

## Container Ramp type MC

---

### Product information

The mobile dock leveler type MC is used for loading and unloading containers, where forklifts with up to 6.0 tons extend and retract.

Built-in forklift pockets allow the dock leveler to be transported quickly and easily to the appropriate loading points.

2 chains to secure the MC bridge are attached to the container.

The very stable design makes it possible for forklifts in these weight classes to be used without any problems in a very robust environment.
